# GANDY ANGUS

DIAMOND TREE

## 2023 YEARLING BULL SALE

Friday 28<sup>th</sup> April, 1pm AWST  
50 Yearling Bulls

Boyanup Saleyards | Livestream on  AuctionsPlus

Lot 2 | Gandy Paratrooper T29

Lot 3 | Gandy Geddes T65

Welcome to the

# GANDY ANGUS YEARLING BULL SALE

## 50 Yearling Bulls

---

Sale from 1pm AWST  
Inspections from 10:30am AWST  
Complimentary lunch provided

**SALE VENUE**  
Boyanup Saleyards, Salter Road, Boyanup WA 6237

**VENDOR**  
Kim & Lex Gandy  
Eastbourne Road, Diamond Tree via Manjimup WA 6258  
M: 0428 761 348

# SALE INFORMATION

## FERTILITY

We endeavour to ensure that all bulls are capable of service, structurally sound and in satisfactory working condition at time of sale. All bulls were semen tested on 30/3/2023 and are guaranteed fertile for 12 months from the date of sale. No warranty is given for any bull, which becomes infertile or incapable of natural service due to illness, injury or disease. If a bull should prove infertile, the purchaser must notify the vendor in writing accompanied by a veterinary certificate of infertility. The vendor retains the right to obtain independent veterinarian confirmation of any claim.

## CONDITIONS OF SALE

The bidder/buyer number system will be used. The conditions of sale are those laid down and displayed by the selling agents. Please register with the selling agents on sale day. Please note that all animals are sold on a GST exclusive basis. GST of 10% will be added to the purchase price.

## NLIS

Intending purchasers please bring your PIC (NLIS) number for ownership transfer.

## TRANSFERS

All bulls will be transferred by Angus Australia.

## TELEPHONE BIDDING

The sale venue offers excellent reception on the Telstra, Optus and Vodafone networks.

## AUCTIONSPLUS

All lots will be available for online bidding via AuctionsPlus. For more information on how to participate visit <http://www.auctionsplus.com.au>.

## INSURANCE

It is suggested that buyers insure their purchases for full cover upon the fall of the hammer. Cattle remaining with the vendor will do so at the purchaser's own risk.

## INJECTIONS

Bulls are Zoetis STAR BREEDER program certified to provide maximal protection against reproductive diseases. This means they have been ear-notched and tested not persistently infected with BVDV (Pestivirus), and have received two injections each of Pestigard, Ultravac 7in1 and Vibrovax. Bulls have also been injected with vitamin B12 plus selenium.

## JOHNE'S BEEF ASSURANCE SCORE (J-BAS)

The Gandy Angus herd is maintained at the J-BAS 8 level.

## ATTENTION ALL PURCHASERS

Please ensure you complete a purchaser's instruction slip available from the registration desk. Verbal instructions cannot be accepted.

## DISCLAIMER

All reasonable care has been taken to ensure that the information provided in this catalogue is correct. However neither the vendors, selling agents or representatives thereof assume any responsibility whatsoever for the correctness, use or interpretation of the information on animals included in this catalogue.

PV: both parents have been verified by DNA, SV: the sire has been verified by DNA,

DV: the dam has been verified by DNA, #: DNA verification has not been conducted

E: DNA verification has identified that the sire and/or dam may possibly be incorrect, but this cannot be confirmed conclusively

## ATTENTION BUYER

Animal details included in this catalogue, including but not limited to pedigree, DNA information, Estimated Breeding Values (EBVs) and Index values, are based on information provided by the breeder or owner of the animal. Whilst all reasonable care has been taken to ensure that the information provided in this catalogue was correct at the time of publication, Angus Australia will assume no responsibility for the accuracy or completeness of the information, nor for the outcome (including consequential loss) of any action taken based on this information.

# UNDERSTANDING EBVs

Angus Breedplan is an advanced genetic evaluation system that provides a genetic description of Angus cattle for a comprehensive range of traits influencing fertility, temperament, foot structure, growth and carcase performance. It provides predictions of the genetic merit of individual animals called Estimated Breeding Values (EBVs). EBVs are based on all available pedigree and performance records provided by breeders in Australia and New Zealand, along with available overseas genetic information.

EBVs are expressed in the units of measurement for each particular trait, and are shown as +ive or -ive differences from the breed base. The average EBV for different traits changes over time as the breed makes genetic progress. All EBVs should be compared to the current breed average shown at the bottom of each last page in this catalogue.

## HOW DO THEY WORK?

Individual EBVs can be used to predict differences between animals in the likely performance of their progeny for particular traits. For example, if we compare a sire with a 600-day weight EBV value of +139kg to another sire with +109kg, the first sire has the potential to produce progeny each weighing an additional  $\frac{1}{2} \times (139 - 109) = +15\text{kg}$  at 600 days of age (progeny receive only half of the EBV difference between sires since the other half of their genes come from their dam). If we assume a sire will produce 200 offspring during his working life, then the benefit of using a sire which produces offspring which are, on average, 15kg heavier at 600-days compared an inferior sire, is considerable.

Remember, when using EBVs to assist in the selection of animals it is useful to consider the figures relative to the values for other animals in the entire Angus population (Aust. & NZ). The percentile band table can be used to find the relative ranking of any trait for any animal compared with the total 2020 calf drop (see last page of catalogue). For example, an animal with a 600-day weight EBV of +139 is ranked in the top 10% of the breed i.e. this animal has a higher value for this trait than 90% of all other animals.

*Birth Weight* is an important consideration when selecting bulls, particularly for heifer mating. The weight of a calf is a contributing factor to calving difficulty. For heifers, we recommend selecting a bull with a birth weight EBV at or below breed average. Cows are capable of handling heavier calves so the use of the Birth Weight EBV is less critical. Angus is an easy calving breed. The actual birth weight of a calf sired by an Angus bull with an above average birth weight EBV may still be well below that of a calf sired by a 'breed average' European breed bull.

*Growth* is an important factor in determining the weaning weight of a calf, or how long it takes to reach a marketable weight. With the rapid price fall that takes place in October/November there is considerable economic value in selecting a bull with a high potential for growth.

*Milk* is not a consideration when using a bull as a terminal sire or when producing females from Fresian or Fresian cross dams. In a self-replacing purebred herd or when used over non-milk breed females, a suitable Milk EBV should be selected to match the level of feed available to the herd.

*Scrotal Size* is an important indicator of fertility of both males and females. Both the fertility of the daughters and the number of calves a bull can sire increases with scrotal size.

*Carcase Weight* indicates variation in the weight of the carcase at 650 days of age. Higher values are desired here.

*Eye Muscle Area (EMA)* at the 12/13th rib site in a 300 kg carcase estimated from ultrasound scanning measurements indicates the muscling ability of the animal.

*Rib & Rump Fat* depth at the 12/13th rib site in a 300 kg carcase are estimated from ultrasound scanning measurements. Fatter cattle may yield less however extremely lean cattle may experience fertility problems.

*Intramuscular Fat (or Marbling)* is required to some extent for the MSA grading system. Consumer satisfaction increases with marbling. The Angus breed is well suited to meet the requirement for marbled product. If you wish to select for marbling we recommend you use the IMF (Intramuscular Fat) EBV for selection purposes.

*Docility* EBVs are calculated from a subjective assessment of temperament when animals are between 60 to 400 days of age. Higher Docility EBVs indicate an animal is expected to produce a higher percentage of progeny with acceptable temperament.

*Net Feed Intake – Feedlot (NFI-F)* EBVs are calculated from the differences in the amount of feed consumed by animals in feed efficiency trials. Lower NFI-F EBVs indicate the animal is expected to produce progeny that eat less feed per day, relative to their weight and rate of weight gain.

*Foot Angle* EBVs are calculated from a subjective assessment of foot angle (strength of pastern, depth of heel), and are expressed in score units. Lower Foot Angle EBVs indicate an animal is expected to produce progeny with more desirable foot angle, being a 45° angle at the pastern joint with appropriate toe length and heel depth.

*Claw Set* EBVs are calculated from a subjective assessment of claw set on both the front and back feet (shape and evenness of claws). Lower Claw Set EBVs indicate an animal is expected to produce progeny with more desirable claw structure, being toes that are symmetrical, even and appropriately spaced.

# SALE INFORMATION

## UNDERSTANDING ACCURACIES

The percentage “accuracy” associated with an EBV gives an indication of its reliability, and the likely extent of its possible change as more information becomes available. EBVs are based on all of the available information at the time of the BREEDPLAN analysis. As more data becomes available for an animal (or its progeny, or relatives) then the accuracy of its EBVs will increase. For example, a bull at two years of age might have EBVs based on his own performance and the performance of his siblings, parents and other relatives. As the bull is used and the growth, carcase and fertility data of his progeny recorded, more information is available about his likely genetic merit. As a result, his EBVs may change and the accuracies will increase.

Accuracies are expressed as percentages. The higher the percentage, the greater our confidence that the EBV is a close estimate of the animal's true genetic merit, and there is a lower likelihood that the EBV will change as more information becomes available. Even though an EBV with a low accuracy may change in the future, it is still the best estimate of an animal's genetic merit for that trait. Generally, as more information becomes available, an EBV is just as likely to increase as it is to decrease.

Only part of the variation that we observe between animals is due to genetic differences. The majority of the variation is generally due to non-genetic factors such as differences in environment and nutrition. The degree to which genetic differences influence performance varies from trait to trait. This is explained by differences in the “heritability” of traits.

Higher heritability values mean the trait of a parent is more readily transferred to and exhibited by its progeny whereas lower heritability values mean the environment has a large influence on the trait exhibited by the progeny. Accuracies are influenced by the heritabilities of traits and the genetic associations existing between them. For lowly heritable traits, more information is required to achieve a similar accuracy to that of highly heritable traits.

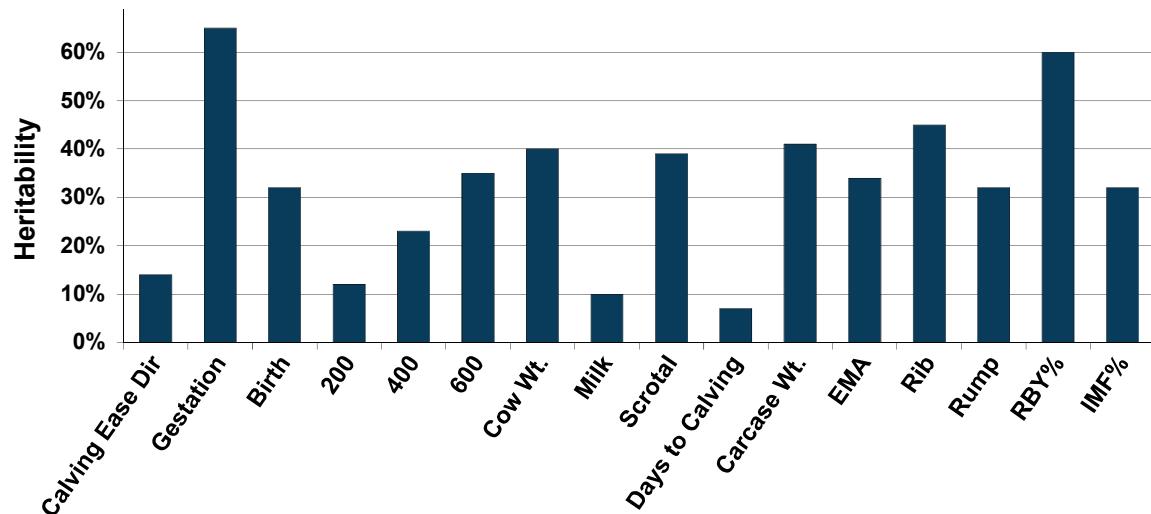

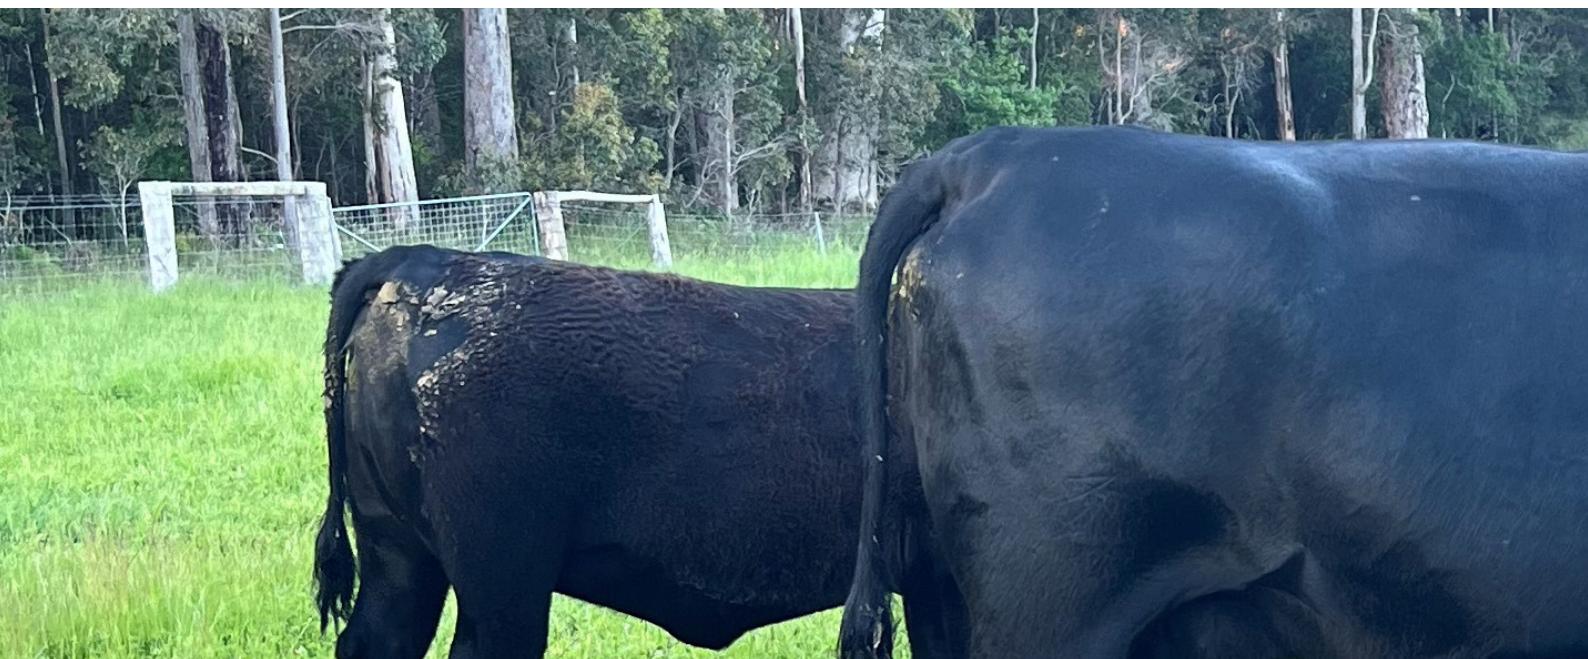

Figure 1. Heritability of Traits for Angus

## UNDERSTANDING SELECTION INDEXES

**Why use Indexes?** In an ideal situation it would be desirable to select animals for breeding that excel in all traits. But, in reality it is always necessary to make some compromises in balancing the strengths and weaknesses among the animals available for selection. A selection index is a formal method of combining EBVs for different traits into a single Index Value. How do Indexes work? Estimates of the genetic relationships between EBVs and the various traits important to a given production system are used to determine a set of index weighting factors to apply to each EBV. The individual EBVs are multiplied by these weighting factors and summed to produce an overall Index Value for each animal. The weighting factors take account of the relative economic importance of the traits in a given production system and the capacity to influence these traits through selective breeding.

**Example:** Index Values can be used to predict differences in the net profit resulting from the use of one bull over another. For example, if we compare a sire with an Index Value of +\$220 to another sire with an Index Value of +\$110 for the same production system, the first sire has the potential to produce an additional  $\frac{1}{2} \times (\$220 - \$110) = \$50$  per cow joined (progeny receive only half of the Index Value difference between sires since the other half of their genes come from the dam). If the sire was joined to a total of 200 cows during his herd life, then we would predict that the superior sire has the potential to generate  $(200 \times \$50) = \$10\,000$  more profit than the inferior sire.

**Index Objectives:** The Angus Breeding Index (AB) and Angus Breeding Low Feed Cost Index (ABLFC) estimate the genetic differences between animals in net profitability per cow joined in a typical commercial self replacing herd using Angus bulls.

These selection indexes are not specific to a particular market end-point, but identify animals that will improve overall net profitability in the majority of commercial, self replacing, grass and grain finishing beef production systems. Daughters are retained for breeding and therefore female traits are of importance.

Both indexes are similar, the difference being the production system on which they are modelled. The AB index caters for production systems where pasture is fully utilised for the majority of the year, while the ABLFC index caters for systems where feed is surplus to requirements for the majority of the year, or the cost of supplying additional feed when animal feed requirements increase, via increased pasture production and/or supplementary feeding, is low. The AB index aims to maintain mature cow weight while the ABLFC Index does not aim to limit an increase in mature cow weight.

Selection Index Summary	
<b>Angus Breeding (AB) Index</b>	<ul style="list-style-type: none"><li>• Self replacing herd</li><li>• Daughters are retained for breeding</li><li>• Identifies animals that will improve overall profitability in the majority of commercial, self replacing, grass and grain finishing beef production systems.</li><li>• Aims to limit increases in mature cow weight.</li></ul>
<b>Angus Breeding Low Feed Cost (ABLFC) Index</b>	<ul style="list-style-type: none"><li>• Identical to the Angus Breeding Index (above), except that this Index does NOT seek to limit increases in mature cow weight.</li></ul>

# CARING FOR YOUR NEW BULL

Respect your bulls, and handle them quietly, walk them rather than rushing them. Treat them with care and in a gentle manner and they will do likewise to you. A bull leaving Diamond Tree is leaving the security of the mob and will arrive in a strange environment at the purchaser's property. Unload him and make sure he has a steer or cow as a companion straight away, if you can't put him out into the mob immediately.

A young bull can move in with older bulls and settle in well, but remember, being the youngest, he will get the last of any feed available, due to the pecking order. The paddock needs to be reasonably large so he can keep away from the others and find adequate feed.

Young bulls are still growing fast and need enough feed to maintain their growth pattern and be able to settle with the cows quickly and efficiently.

Diamond Tree bulls are all injected with 7in1 vaccine (for protection against leptospirosis, pulpy kidney disease, tetanus, blackleg, black disease and malignant oedema) twice at 3 months of age, at a six weekly interval and then they receive a booster as a yearling. A booster injection of Ultravac 7in1 must be given every 12 months to maintain immunity.

When the bull is finished with the cows for the season we suggest he should be drenched and injected with vitamin B12 with selenium. Regular injections of B12 with selenium and drenching will help ensure the ongoing health of your bull.

These bulls will handle approximately 50 cows on their own, or can go in with 100 cows after a good artificial insemination programme.

Diamond Tree bulls are used to being handled with vehicles, four wheeler motorbikes and by stockman on foot. The fences are electrified and the bulls treat them with respect.

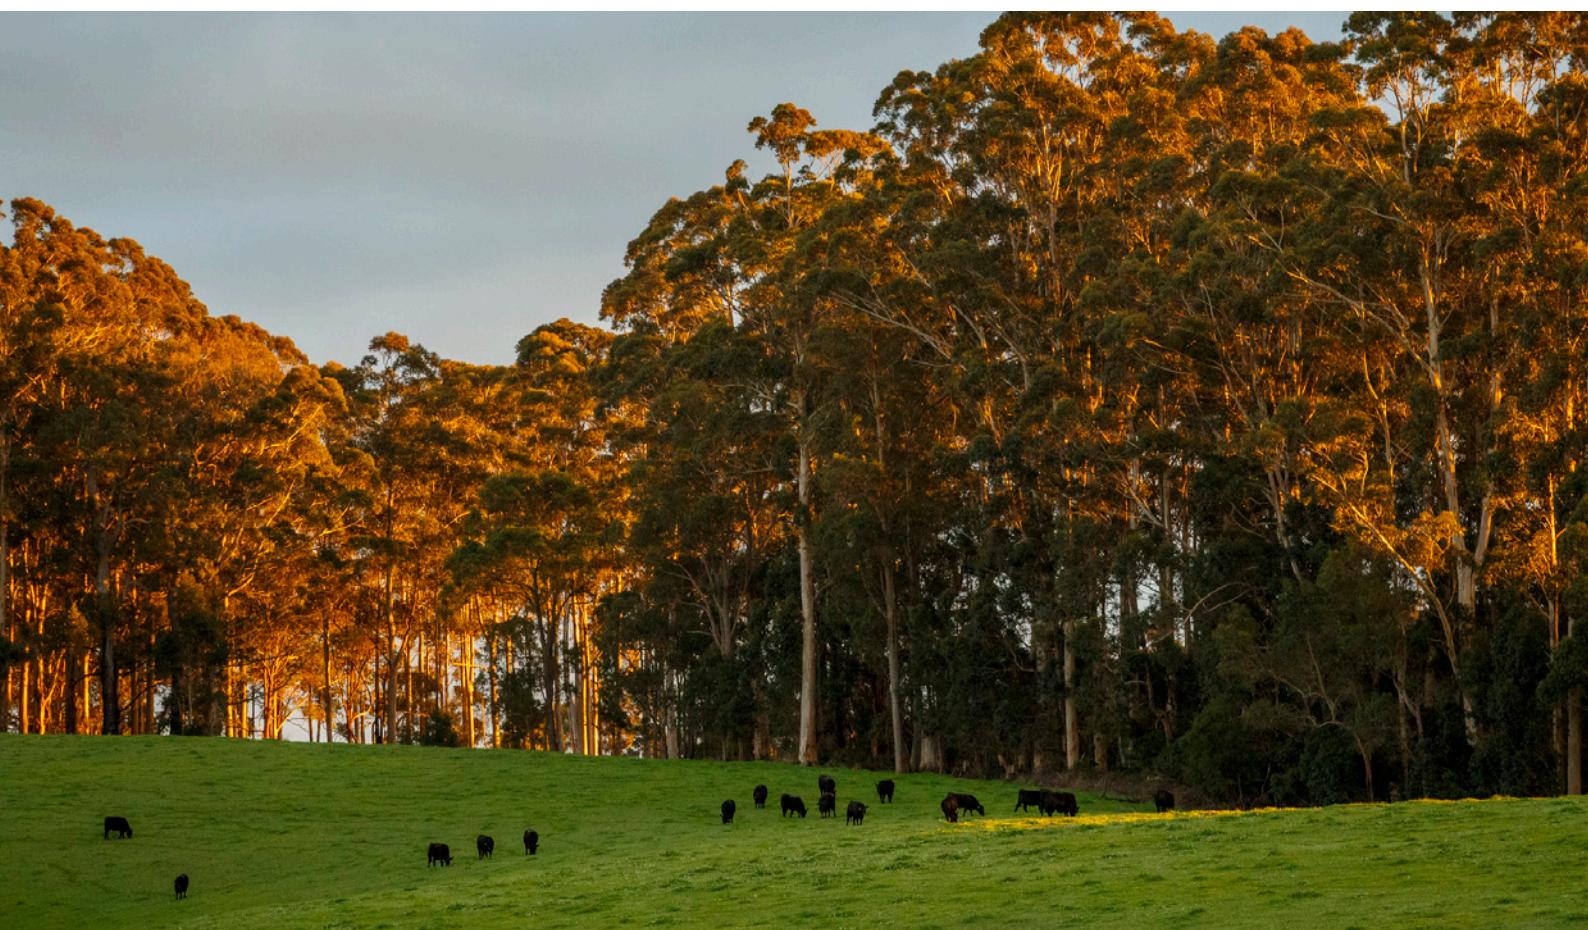

You must always keep a regular watch over your bull when he is out with the cows, as accidents can happen. Every day he is not working will cost you dollars. During the mating season, boundary riding should include the observation of bulling cows, and the bull serving. This is easy because the cows will group together, have full bags of milk and will be followed by male calves.

If the bull does not behave in a normal manner serving, he must be replaced immediately. If a cow has been served before the observer arrives, the bull may not repeat the performance. It has been noted that bulls can simply scratch their penis on dry manure on a cow's backside, infection can set in and a very large and alarming looking appendage can form. If treated quickly and efficiently this can be remedied.

Our veterinary advice is that a suspected broken penis is often just an infection and if observed straight away can be treated and cured.

When the season is finished, the bull should be drenched and put away with enough feed in front of him. Adequate feed will help stop fighting and help the bull settle into the bull group.

Always be considerate to your bull and handle him with respect. You will find you will receive this respect back from him.

Lot 9 | Gandy Checkmate T201

Lot 21 | Gandy William of Stern T122

Lot 11 | Gandy Realist T214

Lot 30 | Gandy Fair N Square T151
